Spectra Connect Quick Start Guide

When you first power up the system, you will get a warning message, asking **if the system has been stored with chemicals**.

If the system has been pickled, winterized, this is the first startup, or the condition of the system is unknown, go to COMMISSIONING on page 23 or serious damage may occur.

Start

Pressing the 'Start' button once advances to the Run Mode selection screen.

Run Mode

Select your desired Run Mode to start making water and filling your tanks. See details on Run Mode options on p. 37

Fresh Water Flush

Pressing the 'Fresh Water Flush' button flushes the watermaker with fresh water from the vessel's domestic water tanks. After completing the flush, Spectra Connect will automatically enter the Auto Store mode.

Stop

Pressing the 'Stop' button from the Home Screen will end the Auto Store mode countdown timer and leave your watermaker in Standby mode.

Spectra Connect Modes and Definitions

Auto Store: After the watermaker fresh water flushes, it will start a countdown timer that can be seen on the Home screen. The timer indicates the next programmed fresh water flush if the watermaker is not started again, or the 'Stop' button is not pressed.

Fill Tank: The watermaker will automatically run until the Tank Full switch in the water storage tanks closes. Once the Tank Full switch closes, the watermaker automatically fresh water flushes, then reverts to the *Auto Store* mode.

Auto Run: The watermaker can be set to run for a number of hours, or for a quantity of water to be produced. When the desired quantity of water is produced or the run timer expires, the watermaker will Fresh Water Flush and enter the *Auto Store* mode.

Thank you for your purchase of a Spectra Catalina 340c system. When properly installed and maintained, it will provide years of trouble free service. Professional installation is strongly recommended. Like any piece of mechanical equipment, the system will require inspection and service, so plan ahead for service access and install “service loops” in cabling. If a dealer is installing the system for you, review the location of the components to ensure the installation will meet your approval upon completion.

Catalina Installation Quick Start Important Details for Installer

1. The system must have a dedicated sea water inlet to guarantee a constant flow of water to the system. The inlet should be as low in the boat as possible with a dedicated, forward-facing scoop-type thru-hull fitting.
2. Both the Catalina 340c feed pump module and the Clark Pump/Membrane module must be installed in a well ventilated compartment where **temperatures will not exceed 113°F (45°C)**. Many engine compartments exceed this temperature when underway. Warranty will be void if the installation does not meet this requirement.
3. Follow the wire gauge charts in the instructions! Using larger wire than specified is acceptable.
4. If you are separating the Clark Pump/membrane assembly, please review the high pressure tube assembly instructions. Improper assembly will cause failure!
5. Run, test, then sea trial the complete system before assuming it is operational. If the boat is in fresh or dirty water, see Dry Testing the System. After testing, make sure the flush cycle operates properly. The water going overboard at the end of the flush should measure <1000 PPM Total Dissolved Solids.
6. The Spectra Connect control must have DC power continuously to achieve the full benefits of the fresh water flush system. The domestic fresh water pressure must be on and the fresh water tank level maintained. Calculate about 7 gallons (27 liters) per flush.
7. The Spectra Connect control must be de-powered (DC power off) after the system is pickled or winterized.
8. Spectra dealers are responsible for educating the vessel owners on the operation and maintenance of the system. Please walk through the entire installation with our customer.
9. The equipment owner should fill out the warranty card or register online.

Installation Notes...

Getting Started

Unpack the system and inspect it for damage during shipping. Freight damage must be reported to the carrier within 24 hours.

Refer to the shipping list for your system to ensure you received all of the components listed. Do not discard any packaging until you have found and identified all of the parts. The small installation parts are listed on the kit list.

Warning! We will not be held responsible for shortages that are not reported within thirty days of the ship date.

Study the system layout diagram, component photos, and descriptions before beginning installation.

Lay out the system. Before starting the installation identify where each module and component will be placed. Ensure that there is enough clearance around the components for removal of filters and system service. Make sure you have adequate tubing and hose before starting. Additional parts may be ordered.

Catalina 340c Shipping List:

- Catalina Feed Pump Module
- 10% Clark Pump and Reverse Osmosis Membrane Module
- Boost Pump and Sea Strainer Module
- Fresh Water Flush Module or Z-Ion
- Service Kit
- 3/4-inch Black Spiral Suction Hose (25 feet)
- 5/8-inch Vinyl Hose (25 feet)
- 3/4-inch Vinyl Hose (10 feet)
- 1/2-inch Vinyl Hose (25 feet) fitted with Quick Connect Fitting on one end, and John Guest stem fitting on the other end.
- 1/4-inch Black Product Tubing (25')

Installation Basics

- **Read the directions!**
- Avoid tight hose bends and excessive runs.
- Use heavy gauge wire.
- Install feed pump module as low as possible.
- Boost pump module must be installed below the waterline.
- Use a dedicated thru-hull with scoop-type strainer.
- Do not mount components over electrical devices.
- **Avoid getting dirt or debris into the piping or hoses during assembly.** A small bit of debris can stop the system!

Thru-hull Location: The system must be connected to a dedicated 3/4" to 1" forward-facing scoop-type intake thru-hull and seacock.

Install the thru-hull intake as far below the waterline and as close to centerline as possible to avoid contamination and air entering the system. Do not install the intake close to, or downstream of, a head discharge, behind the keel, stabilizer fins, or other underwater fixtures.

Thru-hulls in the bow area are susceptible to air intake in rough conditions. Sharing a thru-hull can introduce unforeseen problems such as intermittent flow restrictions, air bubbles, contaminants, and will void the warranty. For racing boats and high speed boats traveling above 15 knots, a retractable snorkel-type thru-hull fitting is preferred because it picks up water away from the hull.

The brine discharge thru-hull should be mounted above the waterline, along or just above the boot stripe, to minimize water lift and back pressure.

Double clamp all hose connections below the waterline.

Avoid restrictions or long runs on the entire inlet side of the plumbing from the thru-hull to the feed pump module.

Secure the piping away from moving objects such as engine belts and hatches. Prevent chafe on the tubing as required. Test and inspect all piping and hose clamps after several hours of operation.

Pipe Fitting Instructions: To seal plastic-to-plastic fittings, wrap 6 to 8 layers of Teflon tape over their threads. Hold the fitting in your left hand and tightly wrap the threads clockwise. For smoother assembly, do not tape the first (starting) threads.

Wiring

- Pay attention to wire size or system performance will be impaired
- Perform wiring to UL, ABYC, CE or applicable standards

Components

Sea Strainer and Boost Pump Module: Mount close to the intake through-hull, below the waterline, in a location that can handle water spillage during service. The boost pump power cable will connect to the feed pump module.

Fresh Water Flush Module: The fresh water flush module may be located in any convenient location near the feed pump module. It should be mounted with the filter housing vertical and accessible, with 2” below the housing for filter changes. Do not install over electrical equipment. The unit contains the charcoal filter, a solenoid shut off valve, and a flush water flow regulator.

IF INSTALLING THE Z±ION, SEE Z±ION INSTALLATION INSTRUCTIONS FOR MORE DETAILS.

Feed Pump Module

Mount the feed pump module on a vertical surface, up to 3-feet (1.0M) above the waterline. It is preferable to mount as low as possible. Locate in an area that allows easy access to both the filters, and the left hand side of the enclosure. Keep future maintenance in mind when choosing a location, and do not mount above water-sensitive equipment. The feed pump has overheat protection and will not operate properly at ambient temperatures over 113°F (48°C).

Components continued...

Remote Touchscreen

The remote control panel can be mounted anywhere dry and convenient. Cut a 5-5/8" (12.7 cm) wide by 3-1/4" (7.62 cm) high opening for the panel. The display needs minimum 2 1/2" deep clearance for the cable. Take care not to damage the plugs on the ends of the cable when routing. **Use only a Spectra-approved cable.**

Clark Pump and Membrane

Pressure Relief Valve

Double rubber mounts
to absorb vibration

This module must be installed in an area that maintains a temperature below 113°F (45°C). It may be placed as high in the boat as you desire, and mounted in any position, even upside down. Make sure that the area around and under the pump does not have any water sensitive equipment, as water will be spilled during any repairs or if a leak occurs. Allow for easy access to the pressure relief valve.

The Clark pump and membrane module comes complete with a mounting system. Be sure to use the supplied washers on the rubber feet.

Plumbing Schematic

From the Clark pump brine discharge connector use the supplied 5/8 (16 mm) clear braided vinyl hose with Quick Connect fitting to the brine overboard fitting.

The optional Z-ION will replace the Fresh Water Flush module

Flush water from ship's pressure water system 25 psi (2bar) minimum and 50 psi (3.5bar) maximum.

Use part of the 25-feet (8 meters) of 1/2-inch vinyl hose, pre-fitted with a 1/2-inch John Guest stem fitting, to connect the feed pump to the Clark Pump feed water inlet. (see following pages)

Use the 1/2-inch vinyl hose with the Quick Connect fitting between the Z-Ion/fresh water flush module and the top of the sea strainer. (see following pages)

Use the supplied 3/4" (19mm) suction hose (clear with black spiral) from the inlet thru-hull to the boost pump/sea strainer module, and from the boost pump/sea strainer module to the feed pump.

Plumbing Detail

From the intake seacock to the sea strainer/boost pump module, and from the sea strainer/boost pump module to the pre-filter housing on the feed pump module, use the 3/4-inch black, spiral-wound suction hose:

Your system includes 25-feet of 1/2-inch vinyl hose with a Quick Connect fitting on one end and a 1/2-inch John Guest stem fitting on the other, both crimped on with ferrules. You will **CUT THIS HOSE** and, using the fittings found in the installation kit, use one end for the feed water inlet hose and the other for the fresh water flush hose:

Fresh Water Flush: Route a feed line from the domestic cold pressure water system to the 1/2-inch hose barb on the fresh water flush module. This needs to be pressurized when the boat is unattended for the fresh water flush system to function properly. *The domestic fresh water pump must be able to deliver 1.5 gallons per minute (6 LPM) at 25 PSI (1.7 bar).*

The optional Z-ION will replace the Fresh Water Flush module

Flush water from ship's pressure water system 25 psi (2bar) minimum

Attaching 1/2-inch vinyl hose to Z-Ion/ fresh water flush module with the pre-fitted Quick Connect fitting:

Attaching 1/2-inch vinyl hose to sea strainer using the 3/8" John Guest stem fitting and hose clamp found in installation kit:

Plumbing Detail continued...

From the feed pump to the Clark Pump feed water inlet, use the remaining 1/2-inch vinyl hose, with the 1/2-inch John Guest stem fitting pre-fitted with a ferrule. Insert the pre-fitted end into the feed pump (Figure 1), and the **1/2"** John Guest stem fitting and hose clamp from the installation kit for the Clark Pump feed water inlet (Figure 2). Refer to John Guest assembly instructions on page 22:

Figure 1:

Figure 2:

Brine Discharge: Route the brine discharge from the quick disconnect fittings to a thru-hull above the waterline using the supplied 5/8" braided vinyl hose and the male Quick Disconnect fitting from the installation kit:

Quick Disconnect Fitting

Product Water Plumbing

The 1/4" (6mm) product water tubing is pre-plumbed from the membrane into the electric diversion valve. The diversion valve will reject product water into the overboard brine stream until the Connect controller determines the product water is below 750 PPM salinity. Once below 750 PPM, the Connect controller opens the diversion valve and product water is diverted into the fresh water tank. **The salinity probe must be mounted in a vertical position with the cable coming out the bottom.** If the Clark Pump/Membrane Module is mounted vertically or upside down the diversion valve/probe assembly **MUST** be remounted in the proper orientation.

For plumbing to the fresh water tank, *see the John Guest fitting assembly diagram on the next*

Product to tank: Route the product water into the top of a vented tank, or a tee in the water tank fill hose. **DO NOT** feed into a vent line, manifold, or into the bottom of the tank. Bladder tanks will create too much back pressure. There must be no restriction or back pressure whatsoever in this piping.

Product Diversion Valve Manifold

John Guest Super Speedfit Fittings

How Super Speedfit Works

To make a connection, the tube is simply pushed in by hand; the unique patented John Guest collet locking system then holds the tube firmly in place without deforming it or restricting flow.

Materials of construction

Super Speedfit fittings are made up of three components:

Bodies are produced in an acetal copolymer or polypropylene.

'O' rings are Nitrile rubber or EPDM.

Collets are produced in acetal copolymer or polypropylene with stainless steel teeth.

How to make a connection

Cut the tube square

Cut the tube square and remove burrs and sharp edges. Ensure the outside diameter is free of score marks. For soft or thin walled tube we recommend the use of a tube insert

Push up to tube stop

Push the tube into the fitting, to the tube stop.

Pull to check secure

Pull on the tube to check it is secure. Test the system before use.

Grips before it seals

'O' ring provides a leakproof seal

The Collet (gripper) has stainless steel teeth which hold the tube firmly in position while the 'O' ring provides a permanent leakproof seal.

Stainless steel teeth grips the pipe

Collet

To disconnect

Push in collet and remove tube

To disconnect, ensure the system is depressurized, push the collet square against the fitting. With the collet held in this position the tube can be removed.

Electrical

The Catalina 340c has a power inlet harness with a terminal block and cover, a boost pump power plug with a yellow band, terminal block for the tank full switch and the optional tank level sensor, and a short plug with a green band for the optional Z-Ion.

Do not install it in hot or poorly ventilated locations. Allow access to the motor speed control.

Tank Full Switch Terminal Block, Green + Orange

*Tank Level sensor
5vdc: Red
Signal: White
Ground: Black*

Spectra Connect controller (Inside control)

Motor speed controller

Run Auto/Manual/Service toggle switch

Electrical continued...

Catalina 340c systems are pre-fitted with waterproof connectors for electrical and signal cables. Each connector is different, so it is impossible to connect them incorrectly, and the connectors are color-coded. The system has a power inlet harness with a terminal block and cover, a 2-conductor boost pump cable, a 5-conductor diversion valve and Rotoflow sensor cable, a 2-conductor fresh water flush solenoid cable, a Z-Ion power and signal cable, and a 50-foot (15M) cable for the Connect display.

Cables are shown coming out of the bottom of the Feed Pump Module.

Diversion Valve and Rotoflow Cable (5-conductor, Red)

Z-Ion power and signal cable (3-conductor, Green)

Fresh water flush solenoid cable (2-conductor, Blue)

The Catalina 340c has three ports that can be viewed when looking down inside the Feed Pump Module; one for the display, one for networking, and one for the salinity probe. The Salinity probe is a 5 pin cable with RJ-12 connectors (phone jack) on both ends this cable runs in parallel. The Display cable is a standard Cat 5e ethernet cable.

50' (15M) cable with connectors for the connect display

Electrical continued...

Connect the yellow boost pump connector from the bottom of the feed pump housing to the corresponding connector routed from the boost pump.

Mount the main power terminal block in a junction box or on a bulkhead adjacent to the feed pump module. Make sure that this is a dry location well above bilge level and not subject to water spray. **Be sure to install the terminal block cover.**

Check the wire size chart for appropriate wire sizes. DC power feeds should be uninterrupted to insure proper operation of the auto store feature. Avoid house breaker panels that could be accidentally tripped.

Component Sizing:

- 12-Volt: Use a 30 Amp breaker and size the wiring for 25 Amperes.
- 24-Volt: Use a 15 Amp breaker and size the wire for 13 Amperes.
- Provide circuit protection at the source! Undersized wiring will

Wire Size Guide for the Catalina 340c 12 Volt:

8 Gauge (10mm²) up to 15 feet (4.5M)
6 Gauge (16mm²) up to 20 feet (7.6M)
4 Gauge (25mm²) up to 35 feet (14M)

Wire Size Guide for the Catalina 340c 24 Volt:

8 Gauge (10mm²) up to 30 feet (10.6M)
6 Gauge (16mm²) up to 45 feet (14M)

Distances at left represent the total ROUND TRIP wire length (DC positive length plus DC negative length), NOT the length of the pair of wires together. Size cables accordingly.

Note: If the specified circuit breaker sizes are unavailable, use the next higher rating but do not exceed the specification by more than 10%. All wiring to be done to applicable ABYC, Marine UL, or CE standards.

Installing a Remote Display

Route the cable through the vessel in the most direct route possible. Avoid kinking the wire, or sharp corners where the wire can chafe through while the vessel is under way.

Turn power OFF to the system.

Connect the ethernet cable to back of the display in the open jack.

Connect the opposing end of the ethernet cable to the RJ12 port labeled "DISPLAY" in the feed pump module.

Remote Display
Plugin

Tank Switch Installation

Factory Supplied Tank Full Switch

Installing the supplied tank full float switch at the top of your water tank allows the Spectra Connect to fill your water tank then automatically stop, fresh water flush and return to Auto Store mode with no additional user commands.

Drill and tap a 1/8" npt port into the top of the fresh water tank that is being filled by the watermaker. This can be installed on a tank access cover, or directly into the water tank. If installing on an access cover, be sure to leave a service loop on the float switch wiring to allow removal of the tank access cover.

The supplied float switch must be connected to the **Green and Orange** conductors at the Feed Pump Module, labeled **Tank Full Switch**. There is no polarity.

Use 18/2 tinned wire or larger. Wire is not included in the installation kit.

Connect to Gr/
Or wires

For Instructions on 'Auto Fill' mode and installing a Tank Low switch, see 'Auto Fill' mode instructions later in this manual.

Watermakers should never be run unattended.

Your watermaker comes with the top-mounted Tank Full Switch (EL-SWT-LV) and is designed to be mounted to the top of the water tank. The side-mounted float switch (EL-SWT-SMLV) can be sourced from your local dealer or Full Service Provider if you cannot access the top of your tank.

If you do not install the Tank Full switch in your tank, you MUST DISABLE the Tank Full Switch in the system settings. See System Settings instructions later in this manual.

Tank Switch Installation

Optional Tank Low Switch

Installing the tank low float switch about 2/3rds down from the top of your water tank allows the Spectra Connect to run in Auto Fill mode; automatically filling your water tank, stopping itself, fresh water flushing, returning to Auto Store mode, and then turning itself on again to fill the tank when the water level drops below the Tank Low Switch with no additional user commands.

Drill 5/8" hole into the side of the fresh water tank that is being filled by the watermaker. This can be installed wherever there is convenient access to the tank, approximately 2/3rds of the way down from the top of the tank.

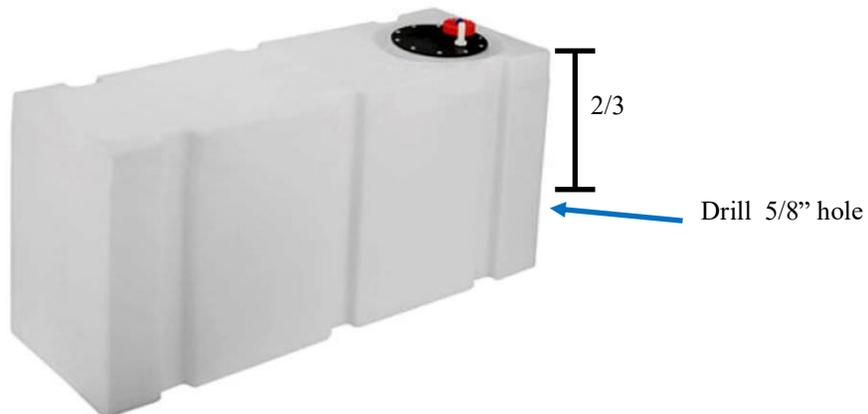

Tank Switch 1

The float switch must be connected to the Tank Switch 1 terminals on the Spectra Connect control board at the Feed Pump Module. There is no polarity.

For Instructions on enabling the 'Auto Fill' mode see the System Settings instructions later in this manual.

Watermakers should never be run unattended!!

Optional Tank Level Sensor Installation

The optional Tank Level sensor allows even greater control of your ship's fresh water systems. This unique level monitoring system requires no holes to be drilled into your tank while measuring tank volume with greater accuracy than a standard resistive float.

Turn off the ship's domestic water system, close the fresh water supply valve at the water tank, then bleed off the pressure by opening a tap in the galley or head sink.

Install a tee in the **water supply hose at the bottom of the tank, or at inlet to the domestic water pump**. Connect open leg of the tee to the Tank Level Sensor. Note: The tank level sensor requires a 1/4" npt connection. We recommend installing a minimum 1/2" tee, and using a reducing bushing to connect the sensor.

Route the 3 conductor cable back to the Spectra Connect control board at the feed pump module. Extend the wires as necessary. *If you must extend the wires beyond 50' contact the factory to ensure proper operation.*

Connect the Tank Level Sensor cables to the 3 conductors label Tank Level Sensors at the feed pump module. **Polarity must be maintained!**

If a 2nd Tank Level Sensor is going to be installed, it should be installed at the base of the second tank. **If monitoring 2 water tanks, they must be isolated from each other with a valve to read properly.**

The wiring connections for the second Tank Level Sensor are located inside the Spectra Connect control box. **See System Settings section of this manual for instructions on enabling the second Tank Level Sensor.**

See the Tank Level Calibration (pg. 28) in the Commissioning section of this manual.

Commissioning

New System Start-Up and Testing

Use this procedure when starting a new watermaker for the first time and **whenever the system contains preservative or cleaning chemicals.**

Avoid running the system if the vessel is in contaminated water, such as a dirty harbor or canal. The system should be fully run tested before leaving on an extended journey. It is preferable to sacrifice a pre-filter by testing the system briefly in turbid water rather than waiting to get off-shore to discover a problem or deficiency in the installation. If the location or weather prevents proper testing refer to the section Dry Testing with an Artificial Ocean.

Warning! Damage may occur if the purge sequence is bypassed and the membrane is pressurized with storage chemical in it.

1. First Check That:

- Seacock is open
- Toggle switch on the Feed Pump Module is in the Run Auto position
- Domestic fresh water pressure system is on.

2. Open pressure relief valve 1/2 turn and remove the Green Tag and washer!

3. Turn on the power to the system and the Spectra Connect screen will display, “Has the system been stored with chemicals?” Press ‘Yes’, to start the Purge sequence. Note: The watermaker will shut down if the pressure relief valve is left closed during the Purge mode.

- Alarm will sound
- Display will read “Has the system been stored with chemicals?”
- Confirm the Pressure Relief Valve is open
- Press ‘Yes’ to start the Purge sequence

New System Start-Up and Testing continued...

- The system will start purging and the display will show the progress and time remaining

Check the strainer and the brine discharge for water flow. The system should fully prime within 60-90 seconds and all air should be out of the feed water hoses. The feed pump will sound smooth.

There should be no bubbles anywhere in the intake hoses. **If the feed pump continues to sound rough, find the reason before continuing!** Inspect the system for leaks.

Note: If you must stop the purge sequence for any reason, the control will default back to the beginning of the purge mode to protect your system.

- After the purge sequence the display will alarm with the message “Close pressure relief valve.” **Close the valve** and proceed by pressing **Ok** to resume the Purge Cycle. *If the system is new from the factory, or stored with Propylene Glycol, additional purging time may be required.*

- The system will now run under pressure and desalinate water. This mode diverts the product water overboard in case there is any residual chemicals in the membrane. **Carefully inspect for leaks over the entire system!** Shut down the system and repair any leaks you find.

- After the Product Purge cycle completes, the system will prompt to **Restart**, then advance to the Main Menu. **If this is a NEW INSTALLATION, continue to the Calibration Instructions to finalize the installation.** If you are putting your watermaker back into service, your system is now ready for use.

Dry Testing with an Artificial Ocean

If it is not possible to test run the system with the boat in the water, you may test the system with an artificial ocean. You will need 1.3 lbs. of non-iodized salt (rock salt, sea salt, or aquarium salt) to make a 5 gallons (33 grams of salt per liter) of water that is about 33,000 PPM salinity (average seawater salinity). Make sure the domestic water system is powered up and the boat's tank has at least 60 gallons (230 Liters) of water to purge the storage chemicals from the system. Confirm that the charcoal filter is installed in the feed pump module, and the domestic water line is connected.

1. **Open the pressure relief valve on the Clark Pump. Remove the green tag and spacer.**
2. Power up the system. When the Spectra Connect displays “**Has the system been stored with chemicals?**”, select “**No**” to bypass the purge mode.
3. Press the **Fresh Water Flush** button to run a full flush cycle. Do this **six** times to purge the storage chemicals, a 36 minute process.
4. Replace the brine overboard hose with the brine service hose per figure 1.
5. Push the **Fresh Water Flush** button again to fill the bucket with fresh water from the brine discharge service hose (hose attached to Clark Pump). Press **Stop** when the bucket is full.
6. Mix the salt to the proper proportion or use an aquarium hydrometer to adjust the salinity level to a specific gravity of 1.025.
7. Disconnect the quick release fitting from the pigtail coming from the charcoal filter housing outlet and connect the intake service hose per Figures 2. Route both service hoses into a 5 gallon (20 liter) bucket. Disconnect the product tube from the diversion valve manifold, and using another small piece of tube, route it into the bucket.
8. Push the **Start** button, then press **Auto Run** and program the Connect to make **10 gal (38 L)** of water, roughly 45 minutes of operation.
9. Allow the system to prime and then close the pressure relief valve. The system should build pressure shortly and start making water, with the brine and product water recombining in the bucket to be cycled again. This will gradually heat the water. Do not let the water temperature exceed 120 deg. F (49 deg. C).
10. Run the system under pressure, checking for proper operation and leaks. After testing the system, re-install the brine discharge hose, product tube, and fresh water hose from the strainer. You can now flush the system by pressing the **Fresh Water Flush** button.

Remove tag
and washer

OPEN PRESSURE
RELIEF VALVE

Fig. 1

Fig. 2

Sensor Calibration

Many of the settings on your system have been pre-calibrated during standard factory testing, however, there are a few settings that will vary based on the installation, vessel, and other onboard conditions. **If the system has just been installed you must calibrate the Prefilter Condition before proceeding.**

Prefilter Condition Calibration

This procedure does **not** need to be done with each filter change under normal operation, it should **ONLY BE DONE IF THE FILTER CONDITION WON'T RESET TO 100% WITH NEW FILTERS AND A CLEAN/NEW STRAINER SCREEN.**

1. During the calibration sequence the system will automatically start, begin to make water for several minutes and then shut itself down. *Make sure that the filters have been replaced for new, the strainer is clean, and all thru-hulls are open before proceeding.*
2. Follow the steps in Figures 1—4 below to initiate the Calibration Sequence.

Fig. 1

Fig. 2

Fig. 3

Fig. 4

3. When the Calibration Sequence is complete, press the **<Back** button in the upper left corner to return to the Main Menu.
*When prompted by the display, Click **Save** to make sure that the Calibration is stored in the system memory.*
4. The Filter Condition has now been calibrated to match your installation.

Calibration continued...

Flush Adjustments

Adjustments for your Catalina 340c are typically calibrated from the factory to ensure that sea water is thoroughly flushed out of the watermaker using the least amount of fresh water.

However, due to different lengths of hose runs, different rates of flow, and different pressures in shipboard fresh water systems, the flush duration should be optimized for your boat. The flush cycle is adjusted with 2 settings: the pump speed and the flush duration.

Check the pump speed

1. Close the thru-hull for the raw water inlet.
2. Push the Fresh Water Flush button. The flush valve will open and the feed pump will start at Flush Speed. If the flush completes normally, then the Flush Cycle is set properly.
3. If the display alarms 'Service Prefilters' then the fresh water pump is not supplying enough water, and the feed pump needs to be slowed down.

Slowing down the pump during a Fresh Water Flush

Inside the feed pump module, under the Conn box, is the pump speed controller. On the speed controller board are two magnetic reed switches for adjusting the pump motor speed. The switches are narrow black bars, 5/8" (16mm) long. The increase speed switch is labeled S2; the decrease speed switch is labeled S3. Each time a small magnet is placed near the switch with the pump is running, the speed will change slightly.

1. Open the thru-hull for the raw water inlet.
2. Push the Fresh Water Flush button.
3. Gently tap a magnet on the S3 Reed Switch (Decrease Speed Switch). Wait 3 seconds between each pass of the magnet.
4. Gently tap the magnet 3 times, then go back to step 3. Repeat this process until the Spectra Connect controller no longer alarms Service Prefilters.

Once you've adjusted the speed correctly, the speed controller will stay programmed for this speed during fresh water flushes.

Flush Adjustments continued...

3. Check/Adjust the flush duration

Run the watermaker for 10 minutes to fill the system with seawater, confirm that the diversion valve opens and water is diverted to the tanks.

Press the 'Stop' button. The system will automatically fresh water flush.

Allow the fresh water flush to continue to completion. At the end of the flush cycle capture some of the flush water at the brine discharge in a clean cup. Measure the salinity of the brine discharge and confirm that it is below 1000ppm using a calibrated hand held TDS meter.

If the flush duration needs to be increased, seek the Spectra Connect programming instructions in this manual.

Tank Level Sensor Calibration

Follow the steps in Figures 1—4 laid out below to enter the calibration sequence for the optional Tank Level Sensor(s).

1. Press the Menu Button

Fig. 1

2. Press the Calibrate Sensors Button

Fig. 2

3. Press the Tank Level 1 button

Fig. 3

4. Fill the fresh water tank to be monitored.

Fig. 4

Tank Level Sensor Calibration—Cont'd

5. Measure the approximate height of the water tank in feet and inches (or in meters and cm's).
6. Press the Feet (Meter) field to enter the tank height in feet (meters). Press the Inch (cm) field to enter the height in inches.

Ex: If the Tank height is 150cm:
 Enter '1' in the field labeled 'Meter'
 Enter '50' in the field labeled 'cm'

7. Press 'Submit' and confirm your entry matches your measurement.

8. *You must save all changes when prompted after exiting the settings menu.*

Salinity Calibration

The Salinity probe has been calibrated at the factory during testing and is not normally required during commissioning. If the product quality is not reading accurately, follow calibration steps.

1. Press the Menu Button

2. Press the Calibrate Sensors Button

3. Press the Salinity—Product Button

Fig. 1

4. Press Continue to acknowledge the warning

Fig. 2

Fig. 3

Fig. 4

5. The system will run for a minimum of 5 minutes to stabilize the product water salinity.
6. Using a calibrated handheld TDS meter measure the salinity of the product water at a sampling port, or a convenient location if no sampling valve was installed.
7. Touch the 'PPM' field and enter the reading taken above.
8. Press 'Proceed' to store the new calibration value. *You must save all changes when prompted after exiting the settings menu*

Product Flow Calibration

The Product Flow sensor has been calibrated at the factory during testing and isn't normally required during commissioning. If the product flow is not reading accurately, confirm the product flow rate by following the Product Flow calibration steps.

1. Press the Menu Button

2. Press the Calibrate Sensors Button

3. Press the Product Flow Button

- Once the system has started and a steady stream of water is flowing from the product water tubing, time in minutes and seconds, how long it takes to fill a container of a known volume.
- Touch the 'Gal' ('Liter') field to enter the volume of the container used.
- Touch the 'Minutes' field to enter the minutes it took to fill the container. *Only enter the minutes, ex: 3 min 15 sec should be entered as 3.*
- Touch the seconds field to enter the seconds it took to fill the container. *Only enter the seconds, ex: 3 min 15 sec should be entered as 15.*
- Press 'Proceed'. *You must save all changes when prompted after exiting the settings menu*

Networking

Your Spectra Connect is equipped with state of the art networking options to allow the maximum user control in a wide variety of installations. The instructions below will help you get the most out of your Spectra Connect.

Note: Your Spectra Connect is only available when your device is connected to the same local network as the Spectra Connect control board. If you have difficulty connecting to your water-maker control application, double check that your device network is the same as your Spectra Connect

Connecting to the existing Network

1. Turn power to the system off.
2. Connect a standard Cat5e or Cat6 ethernet cable from the control board located inside the feed pump module to your ship's router or networking switch.

Ethernet Jack

3. Turn power to the system back on.
4. Follow the screen prompts below:

Note: If you are connecting directly into a wireless router, **DO NOT CONNECT TO THE WLAN (Wireless Local Area Network) ethernet port.** You must connect to one of the router ports labeled 1, 2, 3, 4, etc.

Fig. 1

Fig. 2

Fig. 3

Firmware Rev. : tv2.3.1
Device IP : 192.168.2.196
First Start : Dec 04 2017

5. Note the line 'Device IP' shown in Fig. 3 and record the 10 digit numerical address on the front of this manual.

Connecting to the existing Network—Cont'd

6. Connect your computer, tablet or smart phone to the local network your Spectra Connect is plugged into.

Wired Connection: simply plug your computer's ethernet port directly into the router or switch where you connected the watermaker.

Wireless Connection: make sure your device is connected to the same local wireless network as the Spectra Connect

7. On the computer, tablet or smartphone, open a web browser such as Firefox, Chrome, or Safari. In the web address bar at the top, type the 'Device IP' address previously recorded. Press 'Enter'.

Note: Internet Explorer may not be compatible with your Spectra Connect web app. If formatting issues occur, use another browser such as Firefox, Safari, or Chrome.

Ex: Address Bar—Firefox

8. Your computer should now show the same image as shown on your local Spectra Connect

9. Your web browser is now synced with your Spectra Connect. Any buttons you press on your web browser will be controlling your watermaker.

Caution! If operating your watermaker from a computer, phone, or tablet, you must keep the tab open while the system is in operation and the volume turned up on your device in order to hear any audible alarm faults.

Normal Operation

If the system has been pickled or stored with chemicals, use the New System Startup procedure on page 23.

Your watermaker will fresh water flush **after every use**. Remember that you need to run the system approximately half an hour to make enough fresh water for one flush.

You may notice that the system output is higher when charging your batteries. This is normal.

1. Check to see that the inlet and brine discharge seacocks are open and the domestic pressurized water system is turned on.
2. Press the 'Start' button, then select the desired operating mode.

Standard Operating Modes

Runs your watermaker until the Tank Full switch closes, fresh water flushes the system, then goes into 'Auto Store' mode and the Flush Interval timer starts. *This is the default mode of operation.*

Gives you the option to run for a preset amount of time, or a preset volume of water to be produced. **If no tank switches are installed, and they have been disabled in the system settings, this is the only Operating Mode available.**

Normal Operation—Cont'd

- The system will now begin the start sequence. Pressing 'Stop' will bring you back to the Main Menu.

- Once the Boost Pressure reaches the minimum threshold, the system starts operating and you will be taken directly to the Main Dashboard.

- When the Product Water Quality is below the programmed threshold, the Diversion Valve opens, allowing water to enter the tanks and the screen image changes.

Verify that the system is operating according to the factory specifications detailed on p.36. See the Troubleshooting section to identify any anomalies.

- Pressing the < (Page Left) or > (Page Right) arrows will show a different screen with different operating information for your watermaker.

Normal Operation—Cont’d

8. When the Run Cycle completes, or by pressing 'Stop', the system will start to Fresh Water Flush. **You MUST FRESH WATER FLUSH the watermaker AFTER EACH USE, or serious damage can occur**

8. After Fresh Water Flushing the system will enter the 'Auto Store' mode, and the interval timer until the next scheduled flush will show on the screen.

Nominal Operating Parameters

To access this information about your watermaker while it is running press the < or > buttons to scroll through the pages.

Parameter	Minimum	Maximum
Product Quantity	13.5 GPH (51 LPH)	17 GPH (64 LPH)
Product Quality	N/A	750 ppm
Feed Pressure	N/A	110 psi (7.6 Bar)
Boost Pressure	15 psi (1.1 Bar) or Greater	
Filter Condition	100%	
Amp Draw	19A @ 12.5vdc; 9.5A @ 25vdc	

Normal Operation—Cont'd

Other Operating Modes

Run Low Mode

You can toggle back and forth between Run High Mode and Run Low Mode by tapping the 'High' toggle button.

Run Low Mode may be selected to reduce power consumption or to lower the feed pressure.

Note: The system will automatically drop to Low Mode when it senses high feed pressure, or dirty pre-filters.

Auto Fill Mode

If your vessel is equipped with a Tank Low and a Tank Full switch, **and both are enabled in the system settings**, then your Start Menu will allow the system to be operated in Auto Fill

WARNING: NEVER RUN YOUR WATERMAKER UNATTENDED. EQUIPMENT CAN BE SERIOUSLY DAMAGED, AND IT IS POSSIBLE TO SINK THE VESSEL!!
Use extreme caution when operating in Auto Fill mode!

In Auto Fill Mode the Spectra Connect will automatically fill your water tank, stop itself, fresh water flush, return to Auto Store mode with the flush interval timer running, and then turn itself on again to fill the tank as soon as the water level drops below the Tank Low Switch with no additional user commands.

Additionally, if power is interrupted at any stage of operation, the Spectra Connect will return to Auto Fill mode, ensuring that your tanks will always have water.

Normal Operation—Cont'd

Auto Store

Warning! Proper understanding of the Spectra flush system and the vessel's fresh water system is mandatory for extended use of Auto Store. **The flush cycles must not be allowed to drain all the fresh water from the tank or damage to the vessel's systems and the watermaker may occur.**

The Auto Store function flushes the watermaker at programmed intervals. As long as the watermaker is flushed with fresh water every 5 days (30 days with the Z-Ion) you need not store the system with chemicals.

- **Make sure there is enough water in the fresh water tanks to supply the watermaker for more than the expected time of operation in the Auto Store mode.** If there isn't enough fresh water in your tank, seawater will be drawn in and the system will not be flushed with fresh water. The Catalina 340c requires about 7 gallons (26 liters) for each flush. **The boat's pressure water supply must be on and stay on** while the system is in Auto Store mode. *If these conditions cannot be met, then pickling with SC-1 storage chemical or propylene glycol is preferable.*
- Make sure the pressure relief valve on the Clark Pump is closed.
- **The system must be continually powered on during the Auto Store mode.** Turning off the power will disable the automatic fresh water flush and damage may occur.

Flushes the system with fresh water, then activates the flush interval timer:

Maintenance

General

Periodically inspect the entire system for leakage and chafing. Repair any leaks as soon as you find them. Some crystal formation around the Clark Pump blocks is normal. Wipe down any salt encrusted areas with a damp cloth.

Watermakers are at their best when run regularly. Biological fouling in the membrane is more likely when a watermaker sits idle. A warm environment will cause more growth than a cold environment. A fresh water flush every five days (30 days with the Z-Ion) will greatly reduce biological growth, but may not stop it completely. The Z-Ion system protects the membrane from bio-fouling without the use of storage chemicals.

The Seawater Strainer

The seawater strainer's stainless steel element should be inspected, removed, and cleaned as needed. Ensure that the thru-hull is closed before disassembly and the gasket is in place before reassembly. When the system is put into storage, remove the strainer, rinse with fresh water, and reassemble dry to impede corrosion. Check frequently during operation.

The Pre-filters

Service the pre-filters as soon as possible after the pre-filter condition graph begins to rise. If the filter condition graph gets all the way to "Replace" the machine will slow down. When display reaches "Replace" a second time, the alarm will sound and the system will shut down to prevent damage.

To service the filters close the thru-hull, open the housings, remove the old filters, clean out the housing bowls, and reassemble the housings with new 20 and 5 micron filter elements. The 5 micron filter goes downstream from the 20 micron. Leave dry until next startup.

Use only Spectra-approved filters or you may void your warranty. Occasionally, lightly lubricate the O-rings with silicone grease.

Oil/Water Separator (Optional)

To install oil water separator capability, add a second filter housing UPSTREAM of the 20 and 5 micron housings. Service as you would per the instructions above.

The Charcoal Fresh Water Flush Filter

Replace the charcoal filter element at least every 6 months. This filter protects the membrane by removing chlorine from the flush water. Use only a Spectra-approved replacement.

Maintenance Cont'd

Leaking Fittings

The system has eight high pressure fittings, two on each cylinder on the Clark Pump, two on the pressure vessel end caps, and two 90-degree elbows on the back of the Clark Pump. As the compression fitting is tightened, it compresses a ferrule onto the stainless tubing, fixing the ferrule permanently to the tube and holding the compression nut captive.

The body of the fitting seals to the underlying component with an O-ring. On the Clark Pump cylinders and the end caps this O-ring is compressed by tightening the entire fitting. The O-rings on the 90-degree fittings on the back of the Clark Pump have captive nuts and washers, which compress the O-rings without turning the entire fitting.

If a tube fitting leaks it can sometimes be resealed by just tightening. You must use two wrenches, a 13/16-inch wrench to hold the base, and a 7/8-inch wrench to turn the compression nut. The 13/16-inch wrench will need to be thin so as not to interfere with the compression nut. If this doesn't work, disassemble the fitting, grease liberally with silicone grease (the ferrule and the threads) and re-tighten firmly.

The base O-rings should be **gently** compressed to achieve a good seal, and may be damaged by overtightening.

Connector O-RING

Ferrule

Stainless Fitting Hex Nut

Nickel-Bronze High Pressure Straight Fitting

Nickel-Bronze High Pressure Elbow

Maintenance Cont'd

The Feed Pump and Clark Pump

The feed pump and the Clark Pump require no routine maintenance except inspection for leaks. Tighten any hose clamps or fittings that show signs of leakage. The high pressure fittings threaded into the Clark Pump have O-ring seals with a straight thread. These should never leak and should never be over-tightened. If one of the tube nuts starts to leak, it can be un-threaded, sealed with a bit of silicone grease or oil, and tightened with two wrenches very tightly.

The Membrane

Membranes are susceptible to mineral scaling, biofouling and oxidation damage. The leading cause of fouling is biological growth that forms when the system is left unused without flushing or pickling. Fouling from mineral scaling can happen under certain seawater conditions, or from rust. Oxidation damage can occur if the membrane comes into contact with any strong oxidant, such as Ozone, Chlorine, etc. Monitor the product salinity and feed pressure for higher than normal readings, take environmental conditions into consideration.

Note that:

- Cold feed water or a higher salinity seawater source can cause high pressure.
- Low product flow is usually due to low voltage, a worn feed pump, or worn Clark Pump.

Due to the unique design of your Spectra system, low product water volume is typically not a membrane problem, but frequently related to low voltage, a worn feed pump head, or a worn Clark Pump. Always perform a flow test before cleaning your membrane.

Test to see if biological growth has occurred: Before running the system, remove the pre-filters and examine their condition. If the filter housings are full of smelly, discolored water, the system was not properly stored. Install clean pre-filters.

Next check the membrane. Detach the brine discharge hose, attach the brine service hose, and lead it to a bucket. Open the pressure relief valve 1/2 turn, and manually run the system for 30 seconds (metal toggle switch on feed pump module). Examine the brine water: If it is discolored and smells bad, perform an SC-2 cleaning with unchlorinated water before running the system pressurized. If the brine is fairly clean, follow the New System Startup procedure on page 24 and run normally. Check for performance. Clean the membranes **only if** performance is reduced.

See the **Cleaning Procedure** for complete instructions.

Maintenance Cont'd

Introduction to Spectra Chemicals

We use four types of chemicals: SC-1, SC-2, SC-3, and propylene glycol antifreeze. SC-1 and propylene glycol are for system storage, while SC-2 and SC-3 are for membrane cleaning. **Do not use sodium-bisulfate, citric acid, or any other storage chemical not supplied by Spectra.** These chemicals, used to store other watermaker brands, will damage the Clark Pump, membrane end plugs, manifolds, and other components. **Using non-Spectra chemicals will void the warranty.**

Note: Never use any chemicals with the system pressurized! Always open the pressure relief valve 1/2 turn. Always follow the instructions for purging the chemicals as shown in the New System Startup section (page 39) of your owner's manual.

Storage

SC-1 prevents biological growth when your system is idle. It should not be used as a cleaning chemical, nor will it protect your system from freezing. A jar of SC-1 is mixed with 1 to 2 gallons of product or dechlorinated fresh water in a bucket and circulated through the system for 10 minutes. This treatment will protect the system for six months, after which the SC-1 treatment must be repeated. To use SC-1, follow the instructions for **Storage Procedure**.

Spectra systems should be stored with propylene glycol if freezing is likely to occur. Propylene glycol can be used instead of Spectra SC-1 storage chemical for storage in any climate, and treatment is effective for one year. Propylene glycol is a food-grade antifreeze used to winterize RV's, boats, and cabins. Do not use ethylene glycol automotive antifreeze, which is toxic and will damage the system.

The propylene glycol formulations sold in marine and RV stores are usually diluted with water. The water remaining in the watermaker before the storage procedure will further dilute the antifreeze, reducing the microbial protection and increasing the temperature at which the mixture will freeze.

Antifreeze labeled "Minus Fifty" is a 25% solution and will begin to form an icy slush at about +15Degrees F (-10C) and will only provide burst protection to about Zero F (-18C). After a further 50% percent dilution by water remaining in the watermaker, "Minus Fifty" antifreeze will only protect from bursting down to about +25F (-4C). Therefore if low temperature freezing protection is required a 60% or stronger antifreeze should be used. 60% solutions are labeled "Minus 100" and will provide burst protection to -15F (-27C) even after a fifty percent dilution with residual water. "Minus 200" formulations are pure propylene glycol.

Maintenance Cont'd

Introduction to Spectra Chemicals—Cont'd

Complete microbial protection requires a 25% solution of propylene glycol, so care must be taken that the solution remaining in the watermaker during long term storage is at least 25%, even if freeze protection is not required. For these reasons Spectra recommends that all pickling be carried out with a 60% or greater concentration.

See **Winterizing with Propylene Glycol**.

Propylene glycol can be difficult to flush from a membrane, especially after extended storage periods. This results in high salinity water (high PPM) and residual flavor in the product water. We recommend flushing the system WITH THE PRESSURE RELIEF VALVE OPEN for 4-6 hours after storage with propylene glycol—the longer the better. If, after extended flushing, you still experience low product water quality, cleaning with SC-2 usually removes all traces of propylene glycol and returns the salinity to the level it was before storage with propylene glycol. See the **Membrane Cleaning Procedure**.

Cleaners

Avoid unnecessary cleaning, and avoid cleaning as a diagnostic tool.

SC-2 is an alkaline cleaner used to remove light oil, grime and biological growth. It is most effective if heated to 120 deg. F (49 deg. C). In most cases the water quality will increase in PPM (salinity) after an SC-2 cleaning. After a few hours it should recover to near the level it produced before the cleaning.

SC-3 is an acid cleaner used to remove mineral and scale deposits. In most cases this is used first and if there is no improvement, go on to the SC-2 cleaning. SC-3 will in most cases lower the product PPM and overall pressures. Scaling is a slow process that may take several months or years.

For cleaning with either SC-2 or SC-3, see **Membrane Cleaning Procedure**.

Storage Procedure

1. Close the intake seacock.
2. Push the **Fresh Water Flush** button to fresh water flush the system. Perform a second fresh water flush in the same way.
3. Remove the quick disconnect fitting from the brine discharge outlet of the Clark Pump, per photo below, and replace it with the quick disconnect brine discharge service hose. Lead the brine service hose into the bucket.
4. Push the **Auto Store** button and run the feed pump until you have one gallon of fresh water in the bucket from the brine discharge service hose, then press **Stop**.
5. Mix 1 container of SC-1 storage compound with the water in the bucket.
6. Remove the hose from the “to strainer” pigtail on the feed pump module and install the inlet service hose from the service kit, per photos below. Lead this hose into the 5 gallon (20 liter) bucket as well.
7. **Make sure the pressure relief valve on the Clark Pump is OPEN (un-pressurized) by turning 1/2 turn counterclockwise**
8. Turn on the feed pump by moving the manual control switch on the control box to ‘SERVICE’. The solution will be drawn from the bucket with the service hose, and returned to the bucket from the brine discharge service hose. Circulate the storage chemical in the system for approximately 20 minutes. Stop the feed pump by moving the switch back to the ‘RUN AUTO’ position.

Clean Up

Remove the brine discharge service hose from the Clark Pump, and replace the brine discharge hose that leads to the thru-hull. You may now pump the bucket dry by moving the manual control switch on the Control Box back to ‘SERVICE’. Stop the feed pump by moving the switch back to RUN AUTO.

Remove the inlet service hose and reattach the hose from the sea strainer to the “To Strainer” pigtail on the manifold at the Feed Pump Module. Drain and clean the strainer and any filters in the system. Reassemble dry. Leave the pressure relief valve open, since the next time you run the system you will need to purge the storage chemicals with the system unpressurized. Turn off the power to the system.

Connecting brine discharge service hose

Removing hose to sea strainer from the “to strainer” pigtail.

Attaching intake service hose to the hose connecting to the sea strainer.

Winterizing with Propylene Glycol

See description of propylene glycol formulations, and purging from system, on pages 52-53.

1. Close the intake seacock.
 2. Push the **Fresh Water Flush** button to fresh water flush the system. Perform a second fresh water flush in the same way.
 3. Remove the hose from the “To Strainer” pigtail, install the inlet service hose from the service kit, and lead the hose to the bottom of a bucket. Connect the brine service hose, and run it into a second container.
 4. Pour 1 gallon (4 liters) of propylene glycol of appropriate concentration (see pages 42-43) into the bucket with the intake service hose.
 5. **Make sure the pressure relief valve on the Clark Pump is OPEN 1/2 turn (un-pressurized).**
 6. Run the feed pump by switching the manual switch on the control box to ‘SERVICE’ until about a gallon of water has flowed from the brine discharge service hose, or antifreeze appears. Propylene glycol will look slightly different, and feel more slippery, than water. Stop the pump by moving the switch back to ‘RUN AUTO’. Add more propylene glycol to the intake bucket if necessary.
 7. Lead the brine discharge service hose into the intake bucket of propylene glycol. Move the switch back to ‘SERVICE’. The service hose will now draw propylene glycol solution from the bucket, and the brine discharge service hose will return it. Run the feed pump and circulate the propylene glycol for 20 minutes.
 8. Stop the feed pump by switching the toggle switch back to ‘RUN AUTO’. Drain the seawater strainer, the hose leading to the boost pump module, and the hose between the boost pump module and the feed pump module. Disconnect the product tubing from the membrane housing and blow residual water out of the tubing. Empty the charcoal filter housing and flush water lines. Leave the pressure relief valve open, since the next time you run the system you will need to purge the system unpressurized.
- Your watermaker is now protected from freezing and biological growth and freezing for one year.

Removing hose to sea strainer from the “to strainer” pigtail.

Attaching intake service hose to hose to sea strainer.

Connecting brine discharge service hose

Membrane Cleaning Procedure

Spectra cleaning compound (SC-2 or SC-3) must be mixed with fresh water at a ratio of 1 container of compound to 3 gallons (12L) of unchlorinated water. A Catalina 340c system requires one container of compound per cleaning.

1. Close the intake seacock.
2. Push the **Fresh Water Flush** button to fresh water flush the system. Perform a second fresh water flush in the same way.
3. Remove the quick disconnect fitting from the brine discharge outlet of the Clark Pump, and replace it with the quick disconnect brine discharge service hose. Lead it into a 5 gallon (20 liter) bucket. Push the **Fresh Water Flush** button and run the feed pump until one gallon of fresh water runs into the bucket from the brine discharge service hose. Press **Stop**.
4. Remove the hose from the “To Strainer” pigtail and install the inlet service hose from the service kit. Lead both hoses into the bucket.
5. **Make sure that the pressure relief valve on the Clark Pump is open (un-pressurized).**
6. Mix the cleaning chemical in the bucket. If possible, heat the solution to 120 F (49 C).
7. Move manual switch on the Feed Pump Module to **SERVICE SYSTEM**. The intake service hose will draw solution from the bucket and the brine discharge service hose will return it. Circulate the solution through the system in this manner for 45 minutes. Stop the pump by moving the toggle switch back to ‘**RUN AUTO**’.
8. If the solution cannot be heated, allow the solution to sit overnight before proceeding to the next step.
9. Replace the brine discharge overboard hose and run the pump until the bucket is empty by moving the manual switch to ‘**SERVICE**’. Return the switch to ‘**RUN AUTO**’.
10. Follow the New System Startup procedures to flush the chemicals out of the system (**DO NOT CLOSE the pressure relief valve!**)
11. The system may now be restarted, flushed, or stored.

Connecting brine discharge service hose

Removing hose to sea strainer from the “to strainer” pigtail.

Attaching intake service hose to the hose connecting to the sea strainer.

Suggested Spares for the Catalina 340c

Short term cruising, weekends etc.

A basic cruise kit A. This kit consists of six 5 micron filters and two packs of SC-1 storage chemical.

Cruising 2 to 6 months at a time.

Two basic cruise kits, one replacement charcoal filter, and one replacement feed pump head.

Longer than 6 months

Additional filters, offshore cruising kit consisting of Clark Pump seals, O-rings, tools and membrane cleaning chemicals. One replacement strainer screen, replacement O-ring for strainer screen, and replacement O-rings for the filter housings.

Common Parts:

Item	Part Number
SC-1 STORAGE CHEMICAL	KIT-CHEM-SC1
SC-2 CLEANER	KIT-CHEM-SC2
SC-3 CLEANER	KIT-CHEM-SC3
BASIC CRUISE KIT A	KIT-BCK-A
OFFSHORE REBUILD KIT	KIT-OFFSH
5 MICRON FILTER	FT-FTC-5
CHARCOAL FILTER	FT-FTC-CC
5" STRAINER SCREEN	FT-STN-5S
OIL/WATER FILTER	FT-FTC-OW
FEED PUMP HEAD	KIT-PMP-140MRF
5" STRAINER O-RING	SO-STN-5SS
FILTER HOUSING O-RING	SO-FHS-10H
SALINITY PROBE	EL-MPC-SP4
CHARCOAL FILTER HOUSING O-RING	SO-FHS-3PCS10

Check calibration • Check cable connections • Clean membrane

Alarm Override and Manual Operation

In the event of a sensor failure resulting in a shut down due to a false alarm, the failed sensor can be overridden using the programming function on the display (page 74). High Pressure, Service Prefilter, System Stalled (airlock), and Salinity Probe Failed can all be overridden and the system will still run automatically with all other functions intact. **Be absolutely certain that the alarm is false before overriding the automatic controls.**

In the event of complete Connect control failure, the system may be operated manually as follows:

- Switch on the feed pump by turning the toggle switch to RUN MAN. The automatic safety controls are disabled in manual mode. Shut the unit down if the Clark pump does not cycle, if air is continuously present in the intake line, or if the feed pump is excessively noisy.
- Always discard the product water for the first few minutes of operation as the initial product water may not be potable. Take a water sample by loosening the 1/4-inch product tube fitting at either the feed pump module or the membrane outlet. Check it with a handheld salinity meter or taste it.
- The diversion valve is an electrically operated three-way valve, which is normally energized by the Connect controls in order to send water to the tank. It will not open automatically in manual mode, and must be opened using the mechanical override button. **The button is located on the side closest to the Clark pump cylinder.** Push the manual override button in and rotate 1/4 turn clockwise to open the valve.

Diversion valve
manual override
button

Catalina 340c Flow Test

The flow test is the most useful diagnostic test for system performance, and should be done before replacing or cleaning your membrane. Changes in production or water quality are normally caused by something **other than** the membrane, unless the system has been left unused for a long time.

Before the flow test, change all filters and clean the sea strainer. Carefully check for water or air leaks, as air in the system will cause low production and erratic salinity. Look for air bubbles in the product flow meter, feed water hoses, and brine overboard hose.

Run the system and watch the feed pressure very closely. If the feed pressure to the Clark Pump is asymmetrical from one stroke to another, this impedes performance. A difference of a few PSI is acceptable, but anything over that is an issue. If the pump is asymmetrical, Clark Pump repairs should be done before continuing with these tests.

If no asymmetry is noted, continue with this test.

You will need a graduated bucket, either a graduated pitcher or large measuring cup, and a stopwatch. Log the voltage at the feed pump at the same time. Confirm at least 12.5 Volts at the feed pump on 12-Volt DC systems; 25 volts on 24-Volt DC systems.

Take two measurements and compare them with the table on the following page. The first measurement is the product flow alone. The second is the product flow combined with the brine discharge flow to get the total flow or feed flow. You may take these measurements by two methods:

1. Time the product flow into a graduated pitcher, then divert both the product flow and brine discharge together into a bucket, timing them to measure total flow.

OR

2. Divert the product flow into the pitcher while diverting the brine discharge into the bucket. Time the flow of both at the same time. After calculating the product flow, pour the pitcher of product into the bucket of brine to measure total flow.

The ratio of product flow to total flow gives us our recovery rate, as a percentage. If the percentage is below the minimum it indicates an internal leak in the Clark Pump.

1. Product Flow: Product flow is expressed in Gallons Per Hour (GPH) or Liters Per Hour (LPH), by this equation:

$3600 \div \text{time in seconds} \times \text{quantity of water in gallons or liters} = \text{GPH or LPH}$
 There are 3600 seconds in an hour.

Example: It took 3 minutes and 35 seconds to collect 1 gallon of product water.

$3600 \div 215 \times 1 = \mathbf{16.74 \text{ GPH}}$ (3 minutes, 35 seconds is 215 seconds)

Example: It took 2 minutes and 25 seconds to collect 2.5 liters of product water.

$3600 \div 145 \times 2.5 = \mathbf{62.07 \text{ LPH}}$ (2 minutes, 25 seconds is 145 seconds)

2. Total Flow or Feed Flow: Feed flow or total flow (brine + product) is expressed in Gallons Per Minute (GPM) or Liters Per Minute (LPM), by this equation:

$60 \div \text{time in seconds} \times \text{quantity of water in gallons or liters} = \text{GPM or LPM}$

Example: It took 1 minute and thirty-seven seconds to collect 5 gallons of total flow.

$60 \div 97 \times 5 = \mathbf{3.09 \text{ GPM}}$ (1 minute, 37 seconds is 97 seconds)

Example: It took 53 seconds to collect 12 liters of total flow.

$60 \div 53 \times 12 = \mathbf{13.58 \text{ LPM}}$

3. Recovery Rate: $\text{Product Flow} \div \text{Total Flow} = \text{Recovery Rate \%}$

Example: $\frac{6.5 \text{ GPH product flow}}{1.7 \text{ GPM total flow} \times 60} = \mathbf{.063 \text{ or } 6.3\%}$

(you must first multiply total flow by 60 to convert from GPM to GPH)

System	AMPS				Feed Press.		Static * Press.	Feed Flow				Product Flow			
	12V	MAX	24V	MAX				Flow		MIN	MIN	Flow	Flow	MIN	MIN
					PSI	bar	PSI	GPM	LPM	GPM	LPM	GPH	LPH	GPH	LPH
Catalina	≈18	20	≈9	10	90-100	6.2-7	25-30	2.8	10.6	2.7	10.2	14	52.9	13.5	51.0

*pressure relief valve open ½ turn

In order to make good quality product water, you need the proper amount of feed water flow, as in the table below. Compare the product flow to the total feed flow. Product flow should be 9.0% of total flow for a Catalina 340c. If product percentage is low, you may have an internal leak in the Clark Pump.

For every $\frac{1}{10}$ th of a GPM feed water flow loss, we will lose about $\frac{1}{2}$ gallon per hour of product flow and the salinity will go up 100 PPM.

Low feed flow combined with low system pressures is most frequently caused by a worn pump head.

Poor Product Water Quality

With any product water quality issue, you must ensure accurate calibration if you are using a salinity meter. For general quality evaluation, your taste is always good enough.

Membranes are not an exact science and two identical systems can have different product quality. World health standards deem water of up to 1000 PPM of total dissolved solids acceptable for drinking. We consider any thing below 750 PPM acceptable but not ideal, and anything below 500 PPM excellent. Factors that could affect water quality are addressed below.

LOW SYSTEM FLOW OR PRESSURE will equate to lower product quality (higher PPM). Catalina systems, which have a higher feed to output pressure ratio (See nominal pressures under Flow Test, page 60), as well as a higher feed flow/membrane area ratio, will produce water in the 150-300 PPM range.

DAMAGE TO THE MEMBRANE by chlorine contamination. Flushing the system with chlorinated water will irreparably damage the membrane. Charcoal filters are used to absorb any chlorine which might be present in flush water. They must be of proper specification to be suitable. See page 64. There is no test for chlorine damage except the process of elimination of other causes.

DIRTY OR SCALED membranes. A dirty (foreign material), scaled (mineral deposits), or contaminated (bacterial growth) membrane can result in poor water quality and abnormal operating pressures. If operating pressures are above normal, then cleaning is indicated. If the system pressures are within operating normal range, cleaning may have little result. Avoid cleaning as a diagnostic tool. Low water quality after storage with propylene glycol can usually be remedied by extended flushing or an SC-2 cleaning. (See pages 52-53.)

MECHANICAL LEAKAGE within the membrane pressure vessel. This is an unlikely but possible cause of poor water quality. A pinched or damaged O-ring within the pressure vessel, a scratch on the product tube on the membrane, a scratch within one of the end caps, or a seal fouled by contamination could allow sea water into the product water.

If system total flow (product plus brine) is 2.7 GPM (10 liters) or above, the membrane is clean, the product flows are consistent with the system flow and the water quality is still not acceptable, then replacement of the membrane is indicated.

Technical Bulletins

The following pages include Spectra's most commonly-used technical bulletins, covering tests, adjustments, troubleshooting, and common points of confusion. Many more technical bulletins are available on the Spectra website, www.spectrawatermakers.com.

ACCUMULATOR PRESSURE

Your Catalina 340c is supplied with a pressure accumulator tank (PL-ACC-TK) installed in the feed water line between the feed pump and the Clark Pump.

The purpose of the feed line accumulator is to reduce the spikes in the feed pressure caused by the cycling of the Clark Pump. If the accumulator is not properly charged it can lead to pressure spikes and system shut down. The accumulator has a Schrader air valve, like a car tire, which allows the internal air bladder of the accumulator to be pre-charged. The accumulator should be pumped up to about 60 psi (4.1 bar) for best results. Add air using a tire pump or air compressor. You can experiment with the exact pressure that will give the best pulsation dampening on your installation.

Schrader valve

PREFILTERS

During normal operation, the feed water is filtered in two stages. First it passes through a fine mesh metal sea strainer, which protects the boost pump from foreign materials and sea creatures. After passing through the boost pump, the feed water passes the filter housings containing the 5 micron element, removing very fine particles that could damage the feed pump or Clark Pump and shorten membrane life. An additional carbon filter prevents the entrance of chlorine during fresh water flushing (see next page).

Pre-filter maintenance schedules will vary widely depending on how and where the system is used. If large amounts of feed water are run through the system in biologically fertile near-shore waters the pre-filter will plug up, water production and quality will drop, and the system pressure will change dramatically. In blue water conditions the pre-filter may only need to be changed every week or two.

When operated for only an hour or two a day in inland or near-shore waters, the trapped plankton will begin to decay in the filters long before the elements plug up. The decaying plankton and bacteria will cause a rotten egg smell in the product water. This decay will set in overnight in tropical waters, or after a week or two in higher latitudes. If handled gently and changed regularly before they get too smelly, filters can be cleaned several times. (See Maintenance, page 50.)

Our filter element part numbers are FT-FTC-XX, where the last digits indicate the micron rating. FT-FTC-5 is for a 5 micron element, FT-FTC-20 is a 20 micron element. The optional oil/water separator is FT-FTC-OW.

CHARCOAL FILTERS

The charcoal filter element (FT-FTC-CC) removes chlorine from the fresh water flush water supply, as the RO membrane can only handle small amounts of chlorine without permanent damage.

The charcoal filter used for the fresh water flush system will not plug up unless you have very dirty domestic water in your boat's supply tank.

The charcoal filter we supply removes 99.7% of the chlorine. Beware when buying other charcoal filters. If they don't specify the percentage of chlorine removed, don't use them. Cheap ones may remove only 60% or 70%. Also, there are aftermarket filters which are very close to, but not exactly the right dimensions, and they will not seal in the housing. If you skimp on the charcoal filter you risk damaging a \$600.00 membrane on the first flush. The other factor is the flow rate that the filter can handle. Because the chlorine is adsorbed by the charcoal, it must remain in contact with the charcoal for a sufficient period of time for the all of the chlorine molecules to be captured. The filters we use can handle 1.5 gallons (6 liters) per minute flow, and are good for 3000 gallons (12,000 liters) at 1.5 GPM, or six months, whichever comes first. Regardless of the amount of water treated, the charcoal loses its effectiveness after six months.

Charcoal filter, Spectra part number FT-FTC-CC

Spectra Connect Settings

Your new Spectra Connect is designed to make your watermaker easier than ever to operate, maintain and enjoy. This section will guide you through some of the more advanced settings options available.

Always use caution when changing any factory default settings, as serious damage can occur.

The Spectra Connect automatically monitors the operation of the system to ensure a long and trouble-free service life. If an operating parameter changes, the Connect can switch operating modes, shut itself down, or automatically store itself in order to protect your watermaker.

It includes advanced calibration sequences to make proper setup and maintenance of your watermaker easier than ever.

The onboard time clock feature allows for temporary power interruptions without detrimental effects on the system. In some cases your watermaker will continue to function in its last known operating state.

The Spectra Connect has built in data logging, allowing for easy access to historical operating data—which can indicate a wearing component or spares to be carried along before a failure occurs.

Built in warnings for preventative maintenance automatically alert a user of pending maintenance items, helping to keep your watermaker's up-time to 100%! Advance warnings are pre-programmed for Prefilter Life, Clark Pump rebuilds, feed pump heads, membranes, Z-Ion reactor rod life, and carbon filter life. These warnings are resettable, allowing you to perform the maintenance before a catastrophic failure, then reset the interval—so you're always on top of the maintenance cycle!

Spectra Connect Settings, Cont'd

User Settings

LCD Brightness: Set brightness of the hardwired display(s) from 10—100%

System Units: Change from US Standard units to Metric

Factory Reset: Resets any changed parameters a user has made back to the factory defaults for that configuration.

Fault Alarms

CAUTION!! Never disable a Fault Alarm without being certain that the issue is with a bad sensor. Disabling a fault and running the system can cause serious damage or injury.

High Pressure Fault: Disables the ‘High Pressure’ shutdown fault in the event of a feed pressure sensor failure.

System Stall Fault: Disables the ‘System Stalled’ shutdown fault in the event of a failed rotoflow sensor. System stalled alarms occur when the control board does not sense any product water being produced, and shuts down to protect the pump from running dry.

Poor Quality Fault: Disables the ‘High Salinity’ shut down fault in the event that the salinity probe has failed or cannot be calibrated within range. **NOTE: The diversion valve will always be active when this fault is disabled. ALWAYS VERIFY PRODUCT QUALITY BEFORE DRINKING. Serious health risks may occur.**

Prefilter Fault: Disables the ‘Service Prefilter’ shut down fault in the event that the boost pressure sensor has failed or cannot be calibrate within range. **CAUTION: Permanent damage to the feed pump can occur if this fault is disabled, use caution when operating this system with this fault disabled.**

Settings

Dealer Access Settings

It is highly recommended that users consult with a factory trained technician before altering any settings behind the 'Dealer Access Point'. **Changing this settings without understanding the full effect of each change can void the warranty of your system, and cause irreparable damage.**

If any settings are inadvertently changed, they can be reverted back to the defaults by using the 'Factory Reset' feature.

Default Login: admin
Default Password: admin

System Model: Configures the Spectra Connect for a different system model from a preset list of options.

Clear Statistics: Resets all of the Estimated Maintenance Intervals back to 100%. This feature should only be used on a brand new system.

Change Username/password: Changes the default username and password. If you forget your changed username and password, a Factory Reset will revert back to the default username and password.

Set MFD: Changes the Manufactured Date on the system. This should only be adjusted if a control board is being replaced on an older system.

Set Serial ID: Changes the Serial Number recorded in the Spectra Connect. This should only be adjusted if a control board is being replaced on an older system.

Limit Runtime: Limits the maximum run time for the system before shutting down and fresh water flushing. Disabling this setting allows the watermaker to be operated 24/7.

Settings

Dealer Access Settings

It is highly recommended that users consult with a factory trained technician before altering any settings behind the 'Dealer Access Point'. **Changing this settings without understanding the full effect of each change can void the warranty of your system, and cause irreparable damage.**

If any settings are inadvertently changed, they can be reverted back to the defaults by using the 'Factory Reset' feature.

Purge Setup: Adjusts the time and maximum feed pressure allowed for the Purge Mode. **CAUTION: Permanent damage to the membrane can occur if this setting is adjusted. Consult the factory before making any adjustments.**

Fresh Water Flush Settings: Allows adjustment of the fresh water flush duration and the interval between flushes. If the Z-Ion is installed, the Flush Interval should be changed to 30 days.

Conductivity Setup: Allows for enabling or disabling conductivity sensors on the feed water and product water. Set the threshold for the diversion valve to divert water to the tanks.

Flow Setup: Allows the user to adjust the flow sensor settings, or disable a flow sensor circuit altogether. **DO NOT USE THIS SETTING TO CALIBRATE THE PRODUCT FLOW.** Follow instructions on calibrating the flow sensor in this manual.

Tank Level Monitors: Enable and disable the Tank Level Sensors, which read the % remaining in the tank, and the tank switches, which allow the system to turn on/off automatically.

Boost Pressure Setup: Enable alternate Boost Pressure sensors, change the Low Vacuum Limit, or Boost Pressure Setpoint. **CAUTION: Permanent damage to the pump can occur if this setting is adjusted. Consult the factory before making any adjustments.**

Low Vacuum Limit: The minimum boost pressure required at the inlet to the pump. This setting prevents the pump from getting damaged by running under high vacuum. Adjusting it to a lower number increases the risk that the pump will suffer damage during normal operation.

Boost Pressure Setpoint: During startup the controller turns on the boost pump and waits for the Boost Pressure to reach the Boost Pressure Setpoint. If the boost pressure fails to reach this setpoint, then the main pump won't turn on. Reducing the Boost Pressure Setpoint may cause the system to start, then immediately shut down due to low boost pressure.

Outlet Pressure Setup: Set High Pressure Limit, enable alternate high pressure sensors, select pressure sensor scaling. **CAUTION: Permanent damage to the pump can occur if this setting is adjusted. Consult the factory before making any adjustments.**

Network Setup: Enabling the Spectra Connect Wireless access turns on a Power Over Ethernet feature on the wired connection. **ENABLING THIS FEATURE CAN CAUSE SERIOUS DAMAGE TO YOUR SHIP'S NETWORK. DO NOT ENABLE THIS FEATURE WITHOUT CONSULTING A QUALIFIED TECHNICIAN OR THE FACTORY.**

Settings

Dealer Access Settings

It is highly recommended that users consult with a factory trained technician before altering any settings behind the ‘Dealer Access Point’. **Changing this settings without understanding the full effect of each change can void the warranty of your system, and cause irreparable damage.**

If any settings are inadvertently changed, they can be reverted back to the defaults by using the ‘Factory Reset’ feature.

Automatic PRV: Enables an optional Automatic Pressure Relief Valve, after it is installed. This setting should remain off unless you are certain that you have this feature installed on your system.

Power Sensor: Enables or disables an optional power sensor, after it is installed.

PH/ORP: Enables an optional pH or ORP meter, after it is installed.

Z-Ion: Enables or Disables the optional Z-Ion system, after it is installed. If the Z-Ion is enabled, you should also adjust the Flush Interval to 30 days.

Tank Level Monitors

Tank Setup - Enable/disable tank sensors.

Enable Tank Switch High - Enable/disable tank switch high. If this is disabled Auto Fill and Fill Tank run modes will not be available.

Enable Tank Switch Low - Enable/disable tank switch low. If this is disabled Auto Fill mode will not be available. Both High and Low tank switches must be enabled for Auto Fill mode.

Enable Tank Level 1 - Enable/disable tank level sensor 1. If this is disabled there will be no tank level reading and tank level gauge will read “!”.

Enable Tank Level 2 - Enable/disable tank level sensor 2..

Fault Handling

Faults are hazardous conditions that might occur during running of your watermaker. The control board has the ability to monitor these faults in real time and take necessary actions to prevent damaging your equipment.

HIGH PRESSURE FAULT

High pressure fault is triggered if

Outlet pressure (Feed/Membrane pressure) > Pressure Limit

If a high pressure fault is triggered, the system goes to low production mode if it is running in high production mode, or stops the operation if it is already running in low production mode. Then the system will begin the Auto Store mode.

Resolutions

Check for kinked or blocked hoses.

Confirm “#3 Sensor PSI High limit” and “#3 Sensor PSI Offset” options on Outlet Settings.

Clean membrane.

SYSTEM STALL FAULT

System stall fault is triggered if

There is no product flow for 1 minute continuously.

If system stall fault is triggered, machine will stop the current run cycle and will prompt to restart. If restarted it will retry the previous running mode. If the stall condition persists even after restart, the system will begin the Auto Store mode.

Resolutions

Confirm product water at membrane endcap.

Check intake line for restrictions, blockages or air leaks.

Close Pressure Relief Valve on Pump.

Confirm controller settings correct.

SERVICE PREFILTER FAULT

The Service Prefilter fault is triggered if

Inlet Pressure(boost pressure) < Low Vacuum Limit

If the Service Prefilter fault triggers, the system goes to low production mode if it is running in high production mode or stops the operation if it is already running in low production mode. Then the system will begin the Auto Store mode.

Resolutions

Change prefilters and the sea strainer screen.

Confirm adequate boost pressure in inlet pressure settings.

Check for obstructions in intake line.

Check sensor for proper operation

POOR QUALITY FAULT

The High Salinity fault triggers if

The Salinity of the product water is above the threshold (measured salinity > Salinity 1 threshold) for more than 8 minutes.

If the High Salinity fault is triggered, the machine will stop the current run cycle and will prompt to restart. If restarted it will retry the previous running mode. If the High Salinity fault condition persists even after restart, the system will begin the Auto Store mode.

Resolutions

Check pump operation - Clark Pump (pressure relief valve closed), Feed Pump (moving water).

Confirm product water quality.

Membrane damage - clean or replace.

Salinity probe out of calibration.

Clean or replace salinity probe.
